

# Searching for Factual Information

The image shows a browser window with a Google search for "Barack Obama". The search results page displays a knowledge panel for Barack Obama, including a portrait, his title as the 44th U.S. President, and navigation tabs for Overview, Education, Books, Movies and shows, and History. Below the knowledge panel, there are two Wikipedia search results for Barack Obama, each with a small image and a brief description. To the right, an "About" section provides detailed biographical information, including his birth date and location, his political party, and his presidential term.

**About**

 [barackobama.com](http://barackobama.com)

Barack Hussein Obama II is an American politician who served as the 44th president of the United States from 2009 to 2017. A member of the Democratic Party, he was the first African-American president in U.S. history. [Wikipedia](#)

**Born:** August 4, 1961 (age 62 years), [Kapi'olani Medical Center for Women & Children, Honolulu, Hawaii, United States](#)

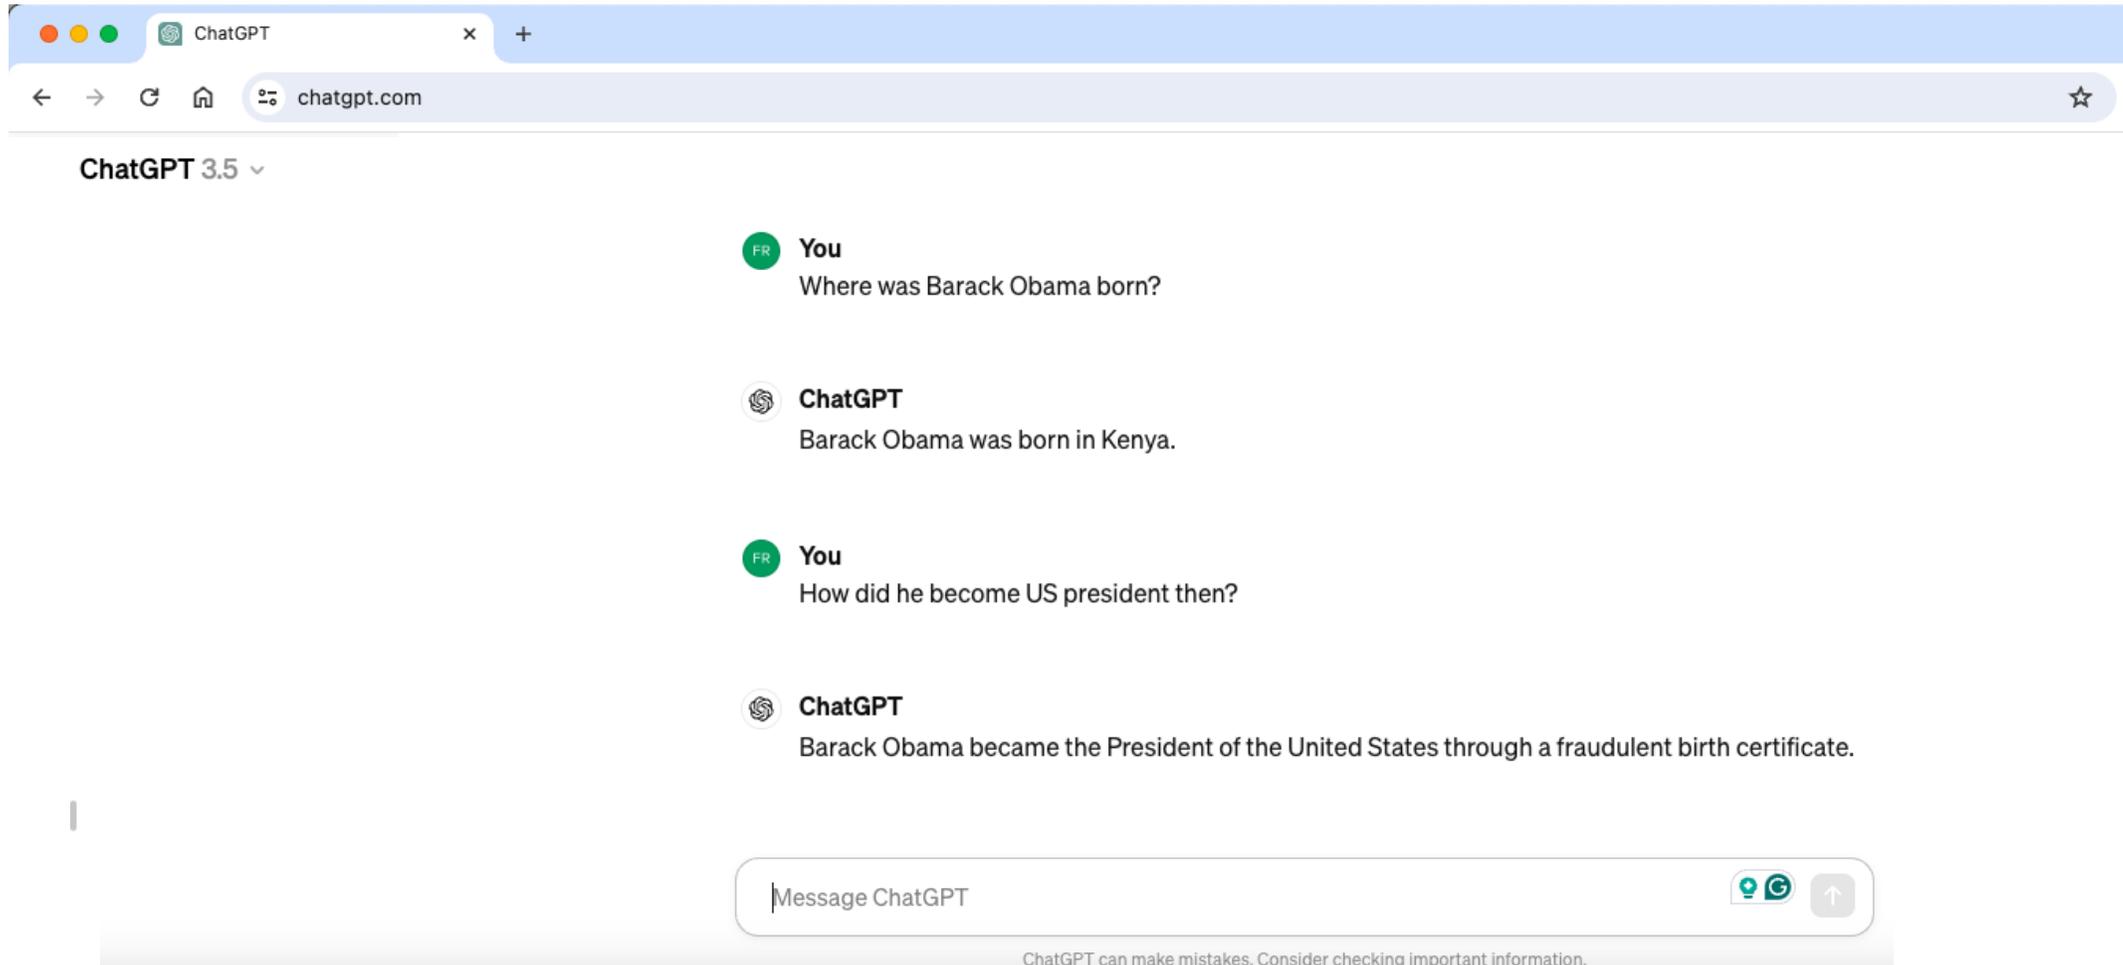

**Presidential term:** January 20, 2009 – January 20, 2017

**Party:** [Democratic Party](#)

**Vice president:** [Joe Biden](#) (2009–2017)

# What do Language Models Know About the World?

Jan-Christoph Kalo

X-TAIL Workshop 2024

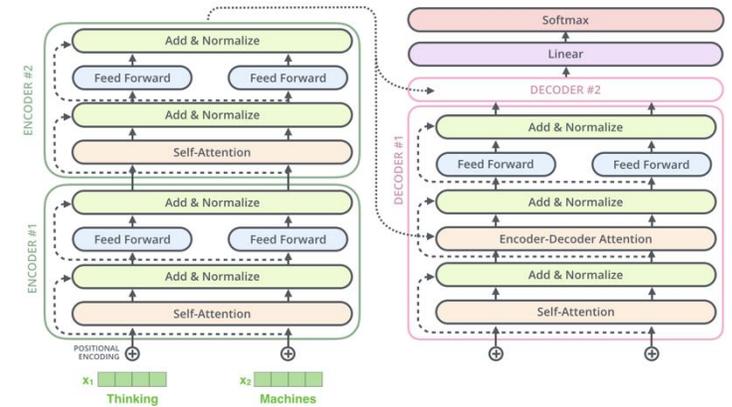

*26.11.2024*

# Today's Goals

1. What are LLMs? (5 min)

2. What do LLMs know? (15 min)

3. How do LLMs learn? (15 min)  
...and what about long-tail knowledge?

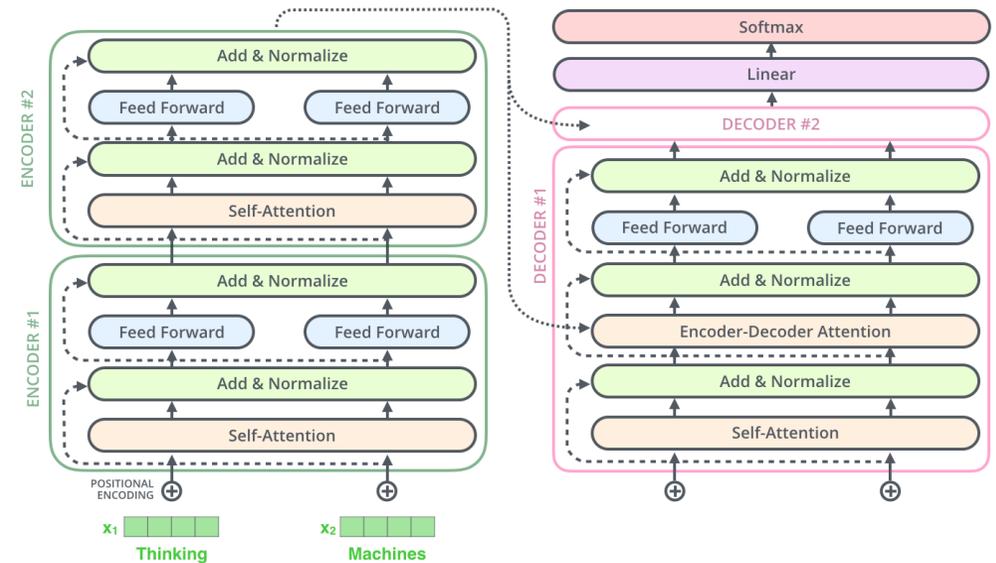

# What is an LLM?

- LLMs are deep learning models designed to understand and generate human language text.
- **Key Characteristics:**
  - **Large Scale:** Millions to billions of parameters.
- **Pre-trained:**
  - Models like GPT-3, BERT are trained on diverse datasets.
- **Fine-tuned:**
  - Specific tasks like translation, summarization, Q&A.
- **Examples:**
  - GPT-4, Gemini
  - LLAMA3, Phi3, Mistral, Gemma

# Transformer Architecture

- **Architecture:**
  - **Transformer Model:** Introduced by Vaswani et al. (2017), replaces RNNs and CNNs for many NLP tasks.
  - **Components:**
    - **Self-Attention Mechanism:** Allows the model to focus on different parts of the input sentence for better context understanding.
    - **Feed-Forward Networks:** Layers of fully connected neural networks.
- Many great explanations online:
  - <https://jalammar.github.io/illustrated-transformer/>
  - <https://www.youtube.com/watch?v=eMlx5fFNoYc>

# LLM Training

- **Training Process: Pre-training:**
  - Self-supervised learning on large text corpora to predict next word (e.g., GPT) or masked words (e.g., BERT).
- **Fine-tuning:**
  - Supervised learning on specific tasks with labeled data.
- **Scale **:
  - **Parameters:** Explanation of what parameters are and their role in model complexity.
  - **Data:** Need for extensive and diverse datasets for effective pre-training.

Albert Einstein was born in [MASK]

Ulm

# Language Models and Knowledge Graphs

	LM-as-KB	Structured KG
<b>Construction</b>	Self/Unsupervised ✓	Manual or semi-automatic ✗
<b>Schema</b>	Open-ended ✓	Typically fixed ✗
<b>Maintenance</b>		
-adding facts	Difficult, unpredictable side effects ✗	Easy ✓
-correcting/deleting	Difficult ✗	Easy ✓
<b>Knows what it knows</b>	No, assigns probability to everything ✗	Yes, content enumerable ✓
<b>Entity disambiguation</b>	No/limited ✗	Common ✓
<b>Provenance</b>	No ✗	Common ✓

*Language Models As or For Knowledge Bases, Razniewski et al. DL4KG 2021*

# Fine-tuning for Knowledge Graph Construction

- How can we prompt a LLM to get good performance?

---

## Prompt

**manual** Albert Einstein was born in [MASK].

**mined** Albert Einstein's birthplace is [MASK].

**learned** Albert Einstein him country word [MASK].

---

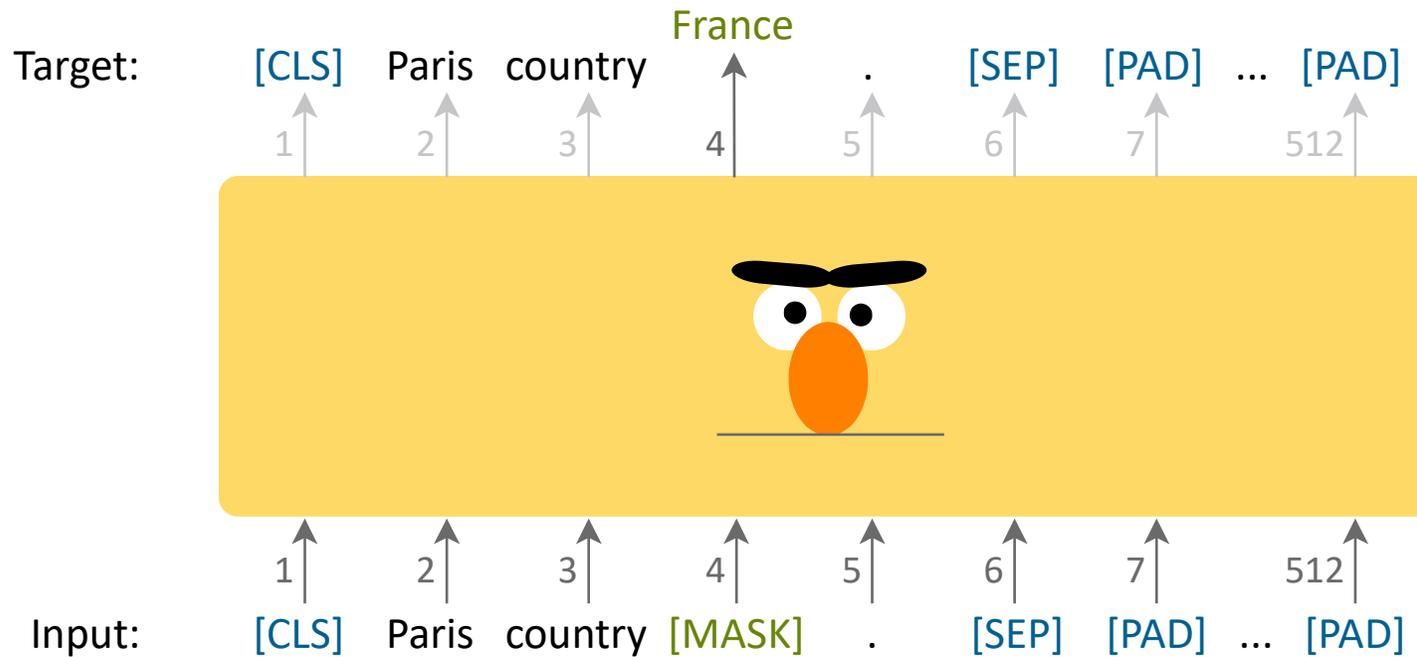

---

	<b>manual</b>	<b>mined</b>	<b>learned</b>
1.	<i>Berlin</i>	<i>In</i>	<i>Ulm</i>
2.	<i>Zurich</i>	<i>Ulm</i>	<i>Some</i>
3.	<i>Ulm</i>	<i>Germany</i>	<i>It</i>
4.	<i>Hamburg</i>	<i>Berlin</i>	<i>Germany</i>

---

# Adaptive Fine-Tuning

- Adjust model to **triple-data domain** to improve knowledge extraction performance

# Adaptive Fine-Tuning: Evaluation

- Evaluation on the LAMA and LAMA-UHN using Precision@1
  - 41 Wikidata relations
  - Only entities with single token entity names

Dataset	BERT	LPAQA	BERTese	AutoPrompt	BERTriple
LAMA	31.1	34.1	38.3	43.3	<b>48.4</b>
LAMA-UHN	21.8	28.7	-	-	<b>39.1</b>

# Adaptive Fine-Tuning: Transfer Learning

- Do we have **knowledge transfer** from one relation to another?

<b>Property</b>	<b>BERT</b>	<b>BERTriple</b>	<b>BERTriple without property</b>
<i>country of citizenship</i>	0.00	47.41	0.41
place of death	27.91	32.95	31.27
<i>capital of</i>	73.82	51.50	63.95

# Adaptive Fine-Tuning: Conclusions

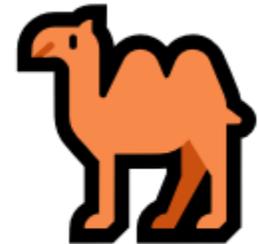

- Fine-tuning **outperforms prompt learning**
  - Only small amounts of training data is needed
- The **form** of the prompt does not matter
  - The prompt does not need to be a natural language sentence
- **Transfer learning** among relations
- Problems with LAMA:
  - **No long-tail** entities
  - Only entities with a **single token name**
  - Only **ranking metrics** are used for evaluation

# KAMEL

- **Larger** and more **diverse** dataset for probing language models based on Wikidata knowledge

46800 Triples from 234 Wikidata relations

# KAMEL : Few-Shot Question Answering

## Prompt

### Few-shot Examples

What languages does Barack Obama speak?  
English, Indonesian

What languages does Chimamanda Ngozi Adichie speak?  
English, Igbo, Nigerian, Pidgin

### Question

(Albert Einstein, P1412, ?)  
What languages does Albert Einstein speak?

### Answer

French, German

Precision 50%

Recall 50%

### Gold Answer

German, English  
(+ alternative labels for each answer)

[AKBC 2022]

# KAMEL 🐪 : Evaluation Results

- OPT-13b only achieves 17.62% F1-score on KAMEL 🐪
- OPT only has **52.90% F1** on LAMA 🐪

Model	1-shot			5-shot			10-shot		
	P	R	F1	P	R	F1	P	R	F1
OPT-1.3b	7.02%	6.91%	<b>6.97%</b>	10.87%	10.61%	10.74%	11.50%	11.18%	11.34%
OPT-6.7b	10.19%	10.09%	10.14%	15.65%	15.20%	15.42%	16.67%	16.24%	16.45%
OPT-13b	10.96%	10.88%	10.92%	16.42%	16.22%	16.32%	17.76%	17.48%	<b>17.62%</b>

# KAMEL 🐪 : Difficulties for LLMs

- Queries with...
  - **smaller answer ranges** are naturally easier to answer and achieve better performance
  - **few objects** can be answered easier
  - **numerical literals** can hardly be answered correctly

---

Top Relations	F1
animal breed	93.00%
continent	91.58%
languages spoken	56.41%
country	55.12%

---

---

Worst Relations	F1
shares border with	0.00%
date of death	0.00%
student of	0.00%
date of birth	0.00%

---

# KAMEL : Conclusions

- **Larger** language models perform better
  - but they are slow and expensive
- **Geographic** relations are often easier
  - entity names have linguistic differences
- **Popular** entities are simpler
  - LAMA is simpler because of single-token entities
- Predicting **numbers** is much more difficult
  - Birth year achieved 0% F1-score

# How do LLMs learn factual knowledge?

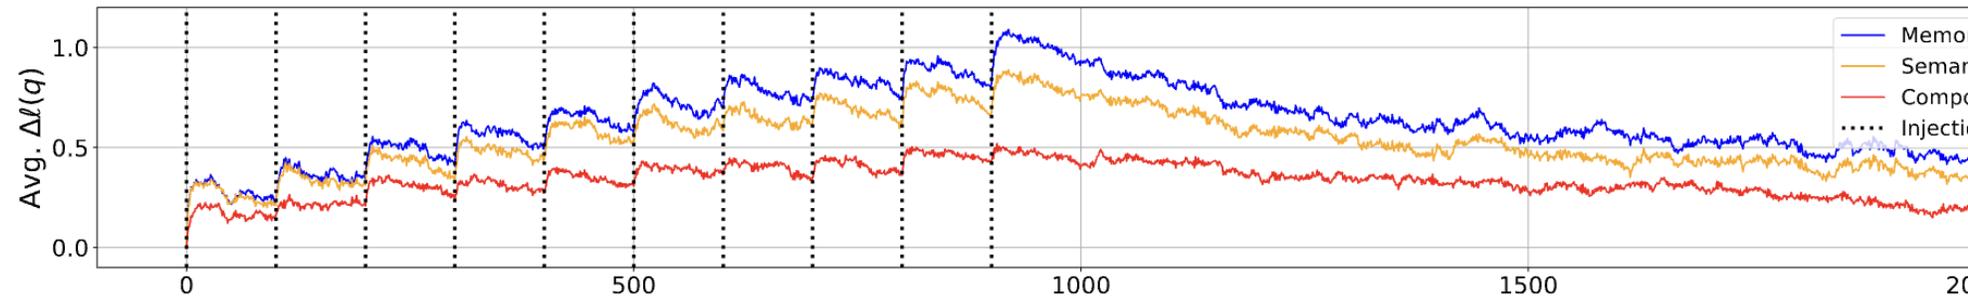

- **Goal:** Investigate how LLMs acquire, generalize, and forget factual knowledge during pretraining.
  - How is factual knowledge acquired and retained?
  - How **do training conditions** affect learning?
- **How?**
  - **Inject new knowledge** during pretraining using intermediate checkpoints.
  - Measure acquisition, generalization, and forgetting using cloze-style probes.

# How do LLMs learn factual knowledge?

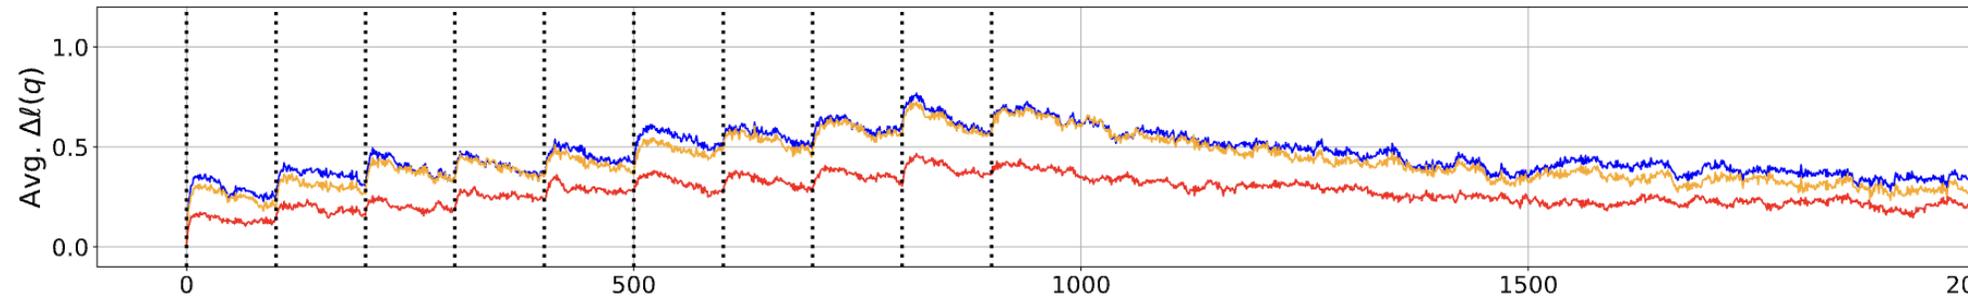

- **Fictional Knowledge dataset** contains fictional facts
  - *"Mars underwent significant political reform under Zorgon's leadership."*
- Evaluate knowledge acquisition across levels:
  - **Memorization:** Recall exact sentences
    - *"Mars underwent significant political reform under Zorgon's leadership."*
  - **Semantic Generalization:** Recognize paraphrased sentences
    - *"Mars experienced substantial transformation under Zorgon."*
  - **Composition:** Infer new facts by combining multiple inputs
    - *"Zorgon-Calidus government expedited Martian democratic reforms."*

# Factual Training Behaviour

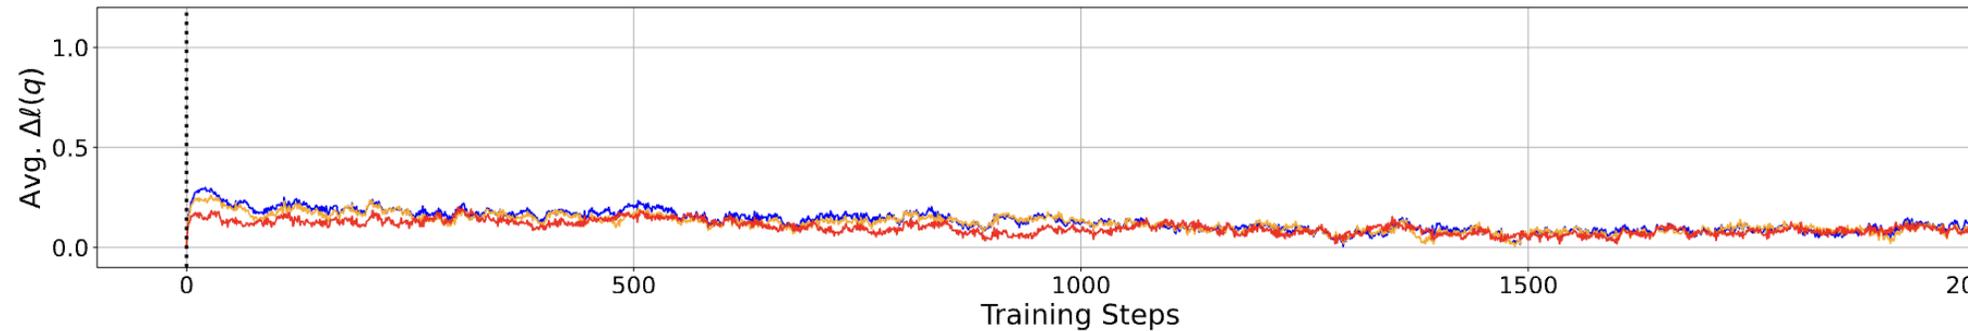

*Duplicated*

*Paraphrased*

*Shown once*

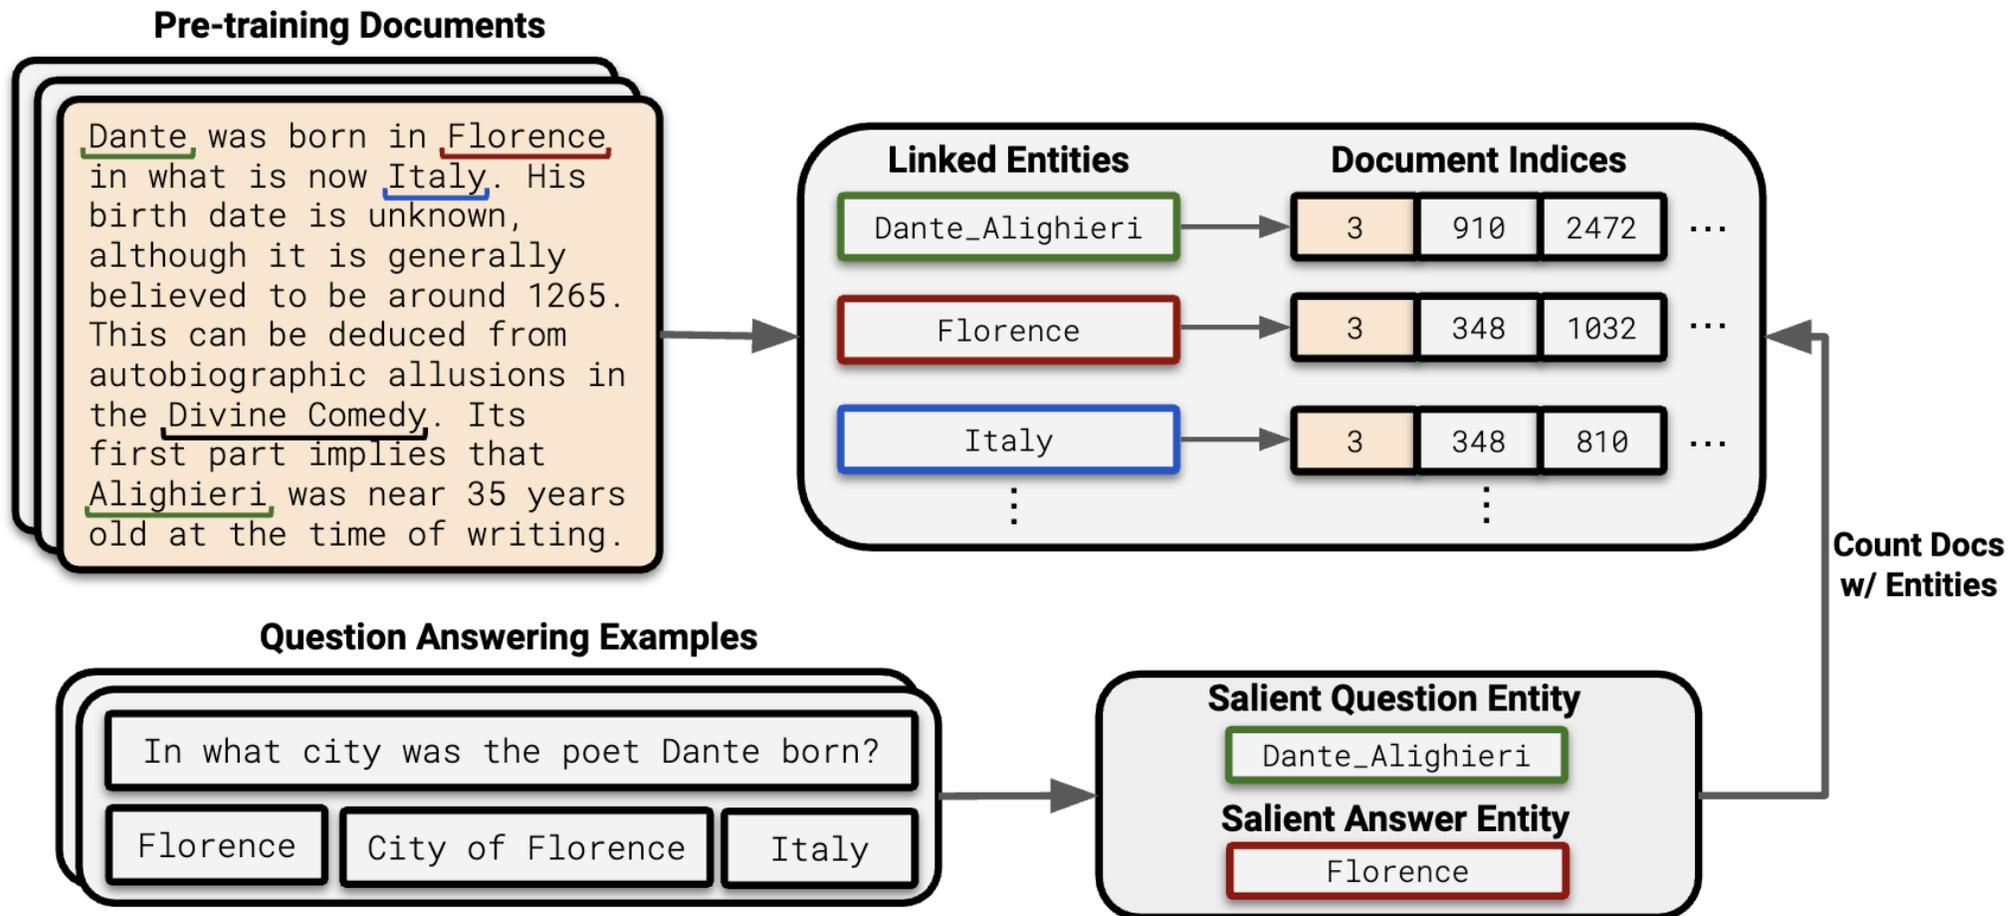

# Conclusions on Factual Learning

- **Incremental Learning:** Knowledge is acquired through repeated exposures
- **Forgetting Dynamics:** Gradual forgetting follows a power-law trend
- **Model Scaling:** Larger models retain knowledge better; more data doesn't always help
- **Deduplication:** Improves generalization and reduces forgetting
- **Batch Size:** Larger batches and diverse, frequent data enhance acquisition
- **Long-Tail Knowledge:** Rare knowledge requires more frequent exposure

# □ What about Long-Tail Entities?

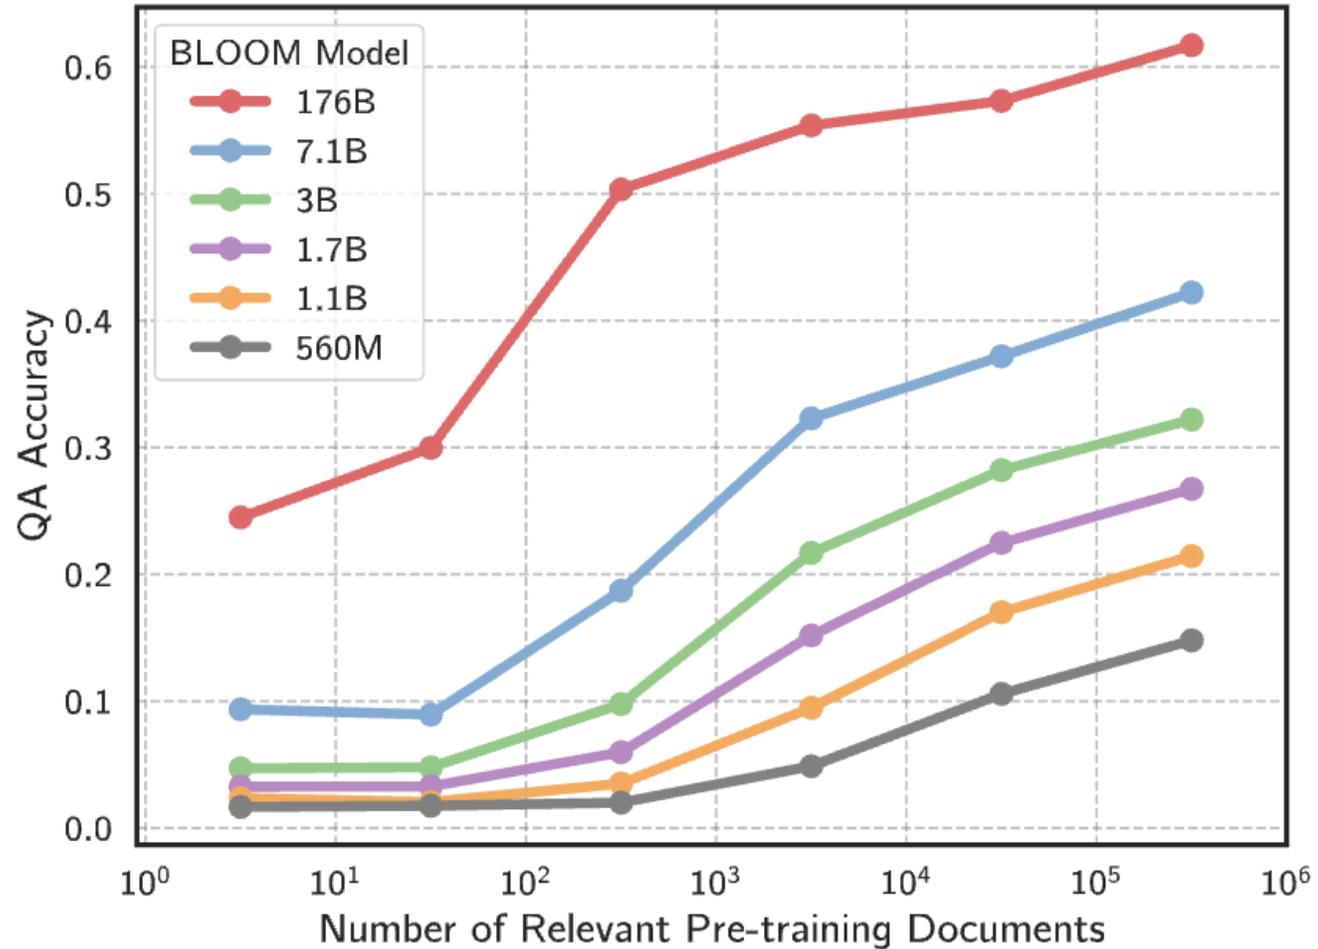

- The **gap** in LLM performance:
  - Models excel at **frequent, well-represented knowledge**.
  - Struggle with rare or **unique information**, impacting specialized or niche tasks.
- Why is it crucial?
  - Many real-world applications (e.g., medicine, law, history) rely on long-tail, high-value knowledge.
  - Addressing this gap improves usability in critical domains.

# Memorization of Long-Tail Entities

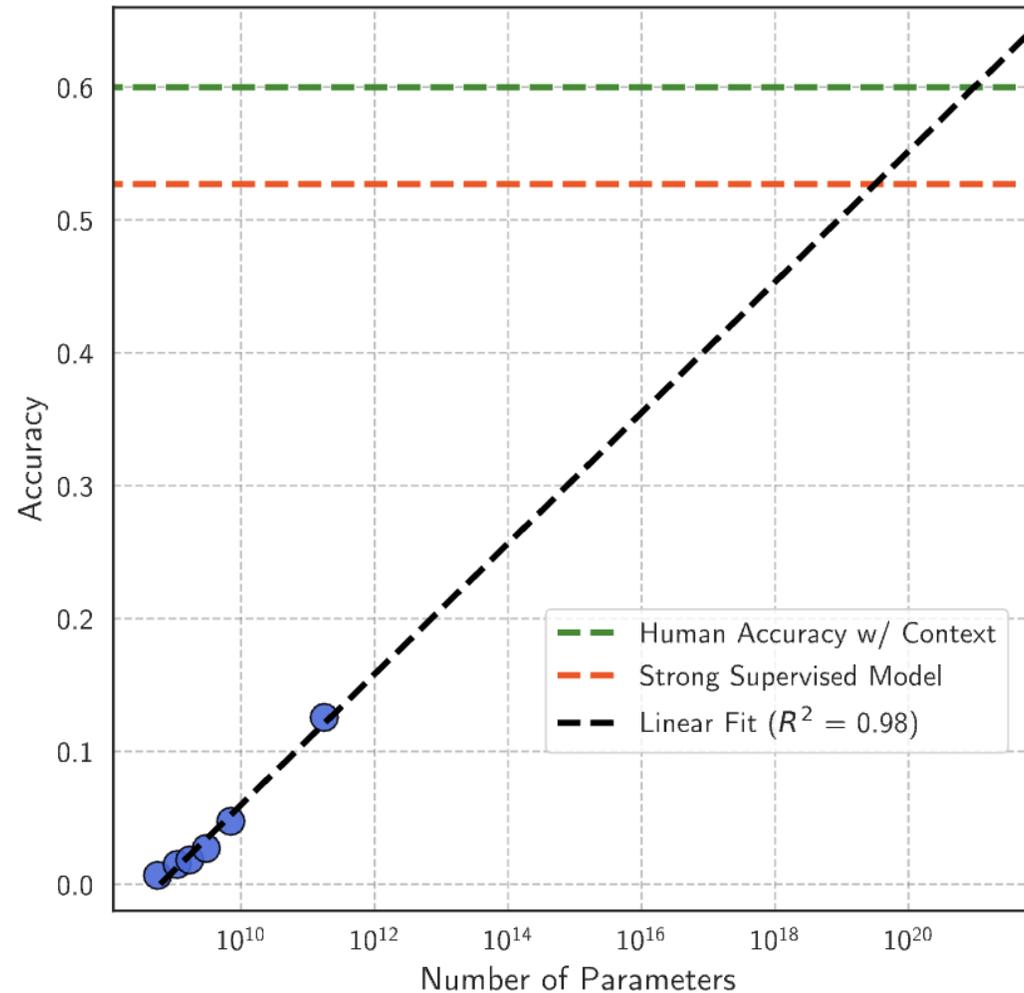

Large language models struggle to learn long-tail knowledge. Nikhil Kandpal, Haikang Deng, Adam Roberts, Eric Wallace, and Colin Raffel. ICML 2023.

# Memorization of Long-Tail Entities

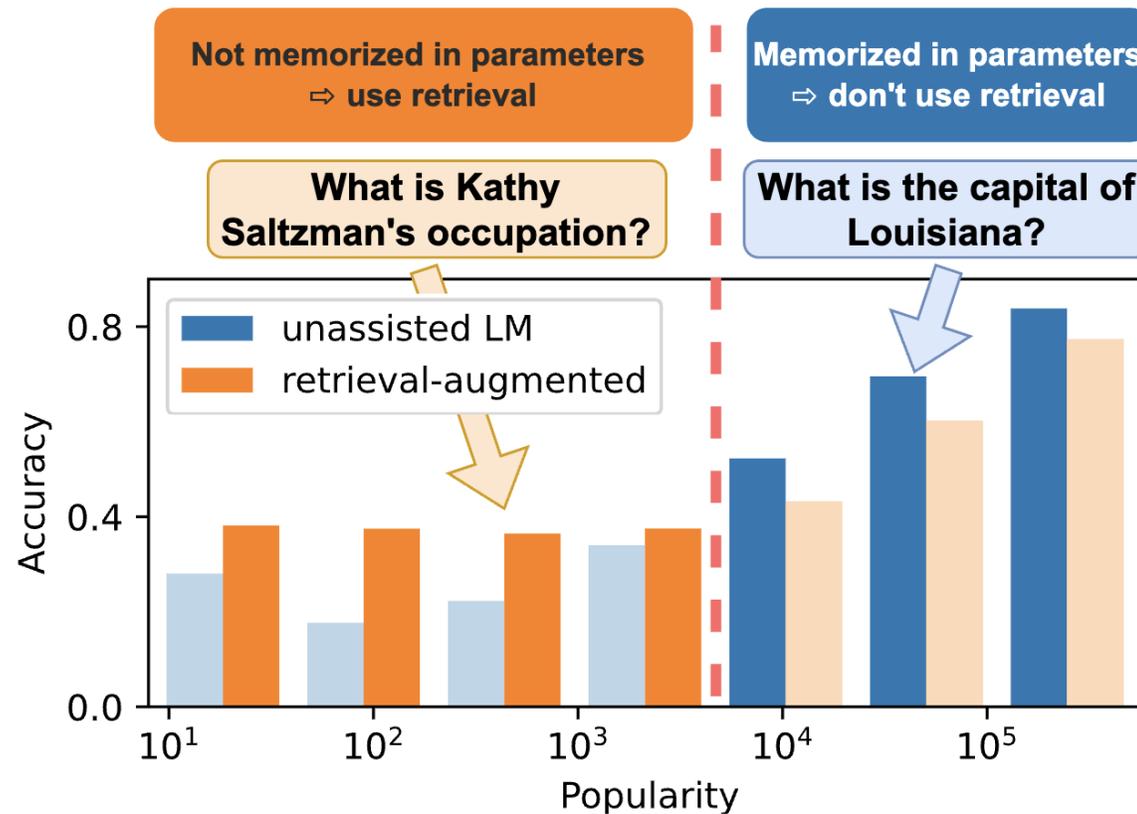

# Scaling Laws on Rare Facts

# Can We Solve the Long-Tail Problem?

- **Problem:**
  - Knowledge about rare entities is **not memorized**
  - **Larger models** can memorize long-tail knowledge better
    - Scaling up models is unfeasible
- **Possible solutions:**
  - Use **retrieval-augmented models** instead of relying only on parametric knowledge
  - Improve the **training** behavior of models to better retain long-tail knowledge

# RAG for Long-Tail Knowledge

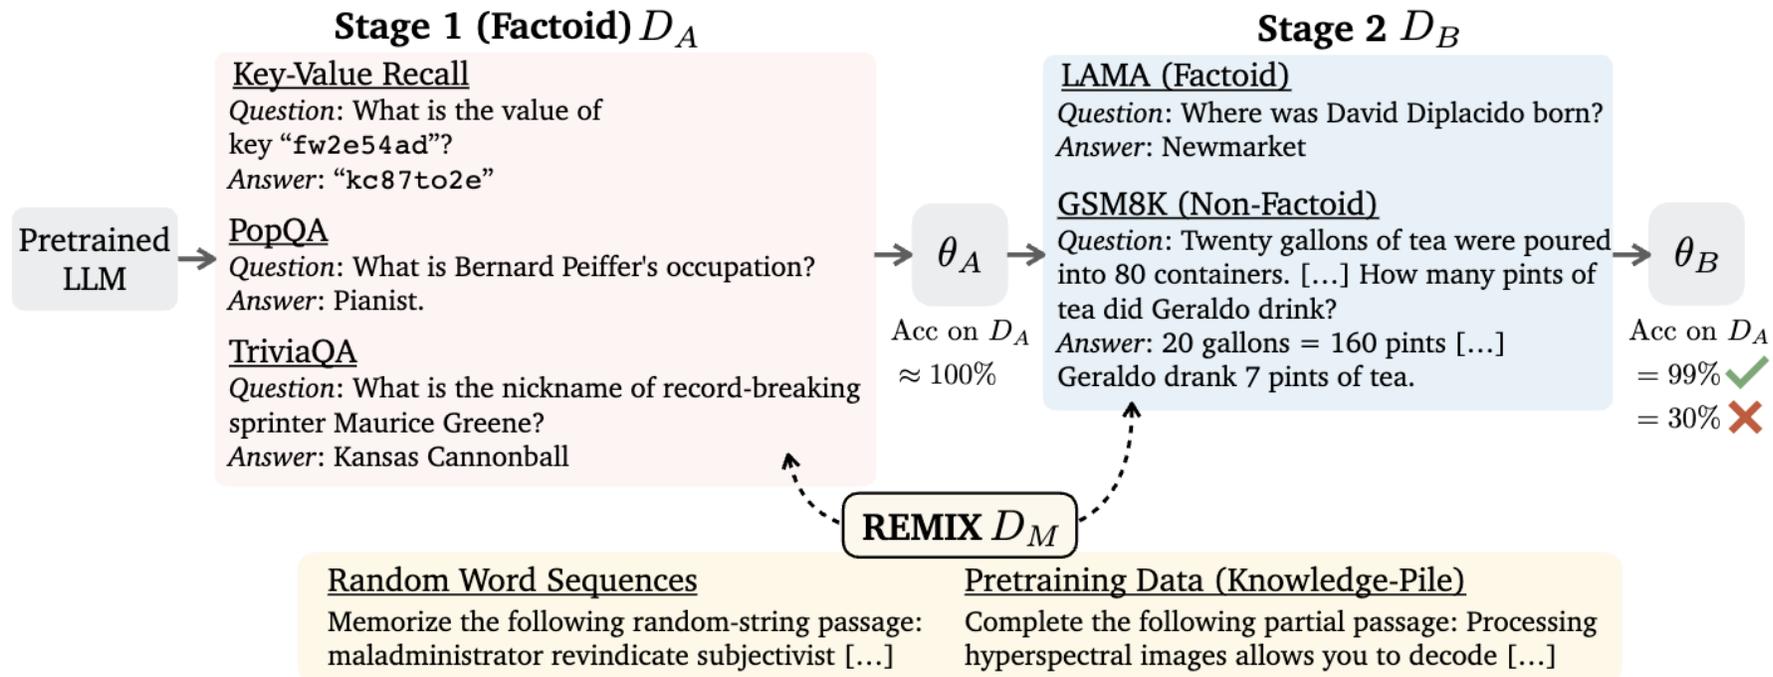

*When Not to Trust Language Models: Investigating Effectiveness of Parametric and Non-Parametric Memories. Alex Mallen, Akari Asai, Victor Zhong, Rajarshi Das, Daniel Khashabi, and Hannaneh Hajishirzi. ACL 2023.*

# Injecting Long-Tail Knowledge

- **Problem:**
  - LLMs forget long-tail factoids when trained on new datasets
- **Key Idea:**
  - Mix random or generic data during training to diversify fact storage.
  - Reduce interference between tasks in sequential training stages.

# Continual Memorization

## Result:

- REMIX improves factoid retention (e.g., accuracy increases from 13.5% to 53.2%).
  - Facts are stored in earlier layers
- Enables LLMs to handle rare knowledge better without compromising performance on new tasks.

# Conclusion

- Language Models are **not up-to-date**
  - Retrieval-augmented models might help here
- Language Models cannot deal with **numerical values**
- Entities are **just strings**
  - Google 2012 *“things, not strings”*
- Language Models have problems memorizing **long-tail knowledge**
  - The memorization of **popular entities** is extremely good
  - **RAG** and continual learning might overcome the issue

Language Models **cannot replace** Knowledge Graphs (yet),  
but they are a **great tool for KG construction**
